4 ~Species from the Family

- Dog (Dog is a domesticated canid over millennia for various behaviours, capabilities and physical appearance.)
- Fox (Fox are small- to- midum sized, beloning to several family of Canidae. They are slightly smaller than a medium sized dog, with a triangular ears, a pointed, slightly upturned snout.)
- The Ethiopian wolf (endangered) (The Ethiopian wolf is a canid notive to the Ethiopian Highlands. It is simmlar to coyote sized with its long and narrow skull, and its red and white fur. Unlike other canid, they can only live in a specific habitat. It is one of the world's most rarest canid.)
- Wild Dog (The African wild dog is a canid native to Africa,it is also the largest of its family in Afric. It is classed as endangered by the IUCN, as it begin to disappeared. The African wild dog is a highly social animal, living in packs with seperate dominace hierarchies for both males and females.

Kindom, Phylum, Class, Order, Family

Kindom: Animalia/ Phylum: Chordate

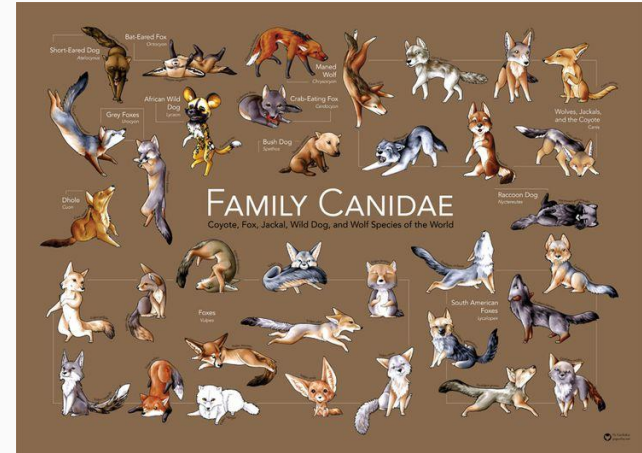

Class, Order, Family

Dog: Mammalia, Carnivora, Canidae

Fox: Mammalia, Carnivora, Canidae

The Ethiopian Wolf: Mammalia, Canivora, Canidae

African Wild Dog: Mammalia, Canivora, Canidae

The Similarities between Canines Animals.

The similarities between Canines Animals need talks two ways physical and mental.

Physical : That they both have same body organism and with same function, and have hairy skin also with the long tail, the special is that the paw can help them maintain the balance also to help them running on the ground.

Mental : They are both social animal and both shows territorial behavior, also they has strong offensive.

The Difference between the Canine Animals.

The difference between Canines Animals need talks two ways physical and mantal.

physical: that their size are different and their hunting skill are also different, and that the wolves have much bigger brain and longer muzzles and legs, larger feet and a broader skull.

mantal: that dog can live with alone but wolves can't, if wolves live alone will not easy survive, and wolves much take care their pack, and take care each other, also in the wolves social that they will have alpha as a leader to leade them.

How the Similarities and difference in animals are adaptations to help them survive.

Adaptations could be physical changes to the animals body or behavioural changes in how an individual animal or a society do things in their daily lives.

Why the endangered animals are endangered and why they cannot adapt to the changing environment.

Four ways make animals become endangered:

1. Destruction of habitat
2. Pollution
3. Hunting and fishing
4. Exotic species

environmental change can happen too fast. Evolution requires generations to function, often many thousands of them, and environmental change can happen much faster than that

Present how those who are not endangered have thrived.

Why dogs can survive for so long ?

Dogs are an animal with a natural instinct to hunt and survive. I'm not trying to say it would be easy but they could learn to survive for sure.

Come up with plan to save the species that is endangered.

- Defending and strengthening the Endangered Species Act.
- Holding federal agencies and others accountable.
- Advocating for increased funding.
- Protecting and restoring the habitats.
- Reducing threats to wildlife.
